

Survey: Your requirements for legume breeding

Photo: DSV

As part of the BELIS research project, we are conducting a Europe-wide survey of everyone who produces, processes, uses or consumes pulses.

The aim of the survey is to provide legume breeding in Europe with practical information. Breeding progress is a key factor in improving the market situation and the competitiveness of European legumes.

We welcome all stakeholders across the legume value chain, from seed production, agriculture, feed and food processing, and the retail sector, right through to the end consumers of legume products. The questionnaire can be completed without any specialist knowledge and takes around 5 minutes.

By taking part, you will help ensure that future breeding activities are better aligned with the real-world needs of your industry. This could also benefit you or your sector, for example through more suitable varieties, distinct raw material qualities, more efficient processing methods, more stable market conditions, or the availability of protein-rich plant-based foods.
